PUWER– Level 1

Practical

What is it?

This course focuses on the ability to observe, describe and recommend appropriate hazards and actions to be included in a PUWER inspection. We stay away from the detail of the law and guidance and instead focus on the practical aspects of doing a PUWER inspection and the common defects that would be observed.

This course will allow up to five persons to complete a PUWER inspection whilst being shadowed and led by a PUWER inspection expert. This session does not address all regulations in PUWER but does provide support and experience in real inspection of machines.

Using our unique [RiskMach](#) software, the learner will carry out machine risk assessments on a tablet, enabling the data to be generated in a report format.

Who is it aimed at?

This course is excellent preparation or a refresher for people looking to develop towards certified PUWER Assessor (CPA) and as such, would suit engineering supervisors, engineering managers, health and safety managers and project managers who are involved in PUWER inspections.

What are the learning outcomes?

-  Calibrate observational skill to the purpose of PUWER inspection to identify relevant defects and make appropriate recommendations.
-  Demonstrate prior learning for the CPA
